The Mars Redback Currency System and it how takes control of the US economy

The Mars 360 social/financial theory takes aspects related to an individual's astrological Mars placement—according to how it is explained in “The Mars 360 Religious and Social System”, and has it displayed within a social environment, and combines that with the aspect of buying and selling within that framework. This means that in order for this currency system to work, a person has to believe that Mars influences human beings. And one does not have to call it faith-based. It can simply be hypothesis-based or theory-based, no different than how quantum theory is fostered in the scientific community. This currency system is similar to how private currencies are issued within local communities to encourage spending and economic development within that community. As a contingency plan in the case of obtuseness toward the impact of inflation, a small community would develop as a scientific study. Within that community, each person would calculate where Mars was at the time they were born according to the framework laid out in the book “The Mars 360 Religious and Social System” which divides the astrology chart into 6 sections. The community would then see to it that the individual's rights under their own Mars influence is not violated....meaning that the characteristics associated with the negative Mars influence (according to where it's positioned in the chart) would be allowed some healthy expression(healthy meaning enough to where humans can still co-exist). Mars is responsible for negative habits dispersed amongst the 6 possible positions: 1. poor face- to-face communication/interaction 2. hyperactivity/reckless thoughts 3. debauchery 4. hyper-opinionated/cultural bias 5. laziness/disobedience and 6. introversion/sillyness. The reason the idea of an outward display of Mars's position in an individual's birthchart is presented is because it would precipitate "understanding," allowing people to prepare or know in advance how to deal with the individual and vice versa without having to go through any extended learning phase, which oftentimes gives rise to contention.

The commercial aspect allows for a dynamic that would encourage buying and selling amongst those who carry some outward form of insignia related to Mars's position at the time they were born, or simply has Mars indicated on their driver's license. This doesn't necessitate issuing a private currency, but due to discrimination laws, issuing a private currency within a local community would be a more feasible legal option. The currency is called the Mars Redback and its growth would follow that old Facebook model, which centered around the private community before slowing branching out into the global sphere. The Mars Redback -- backed by a working model that supports the belief that the planet Mars influences human nature -- could be used within communities of people who have the position of Mars in their birthchart indicated outwardly in some way, either on the right hand or the forehead. In essence, all transactions conducted face to face with the Mars Redback must be done by people who have outwardly indicated their natal Mars position.

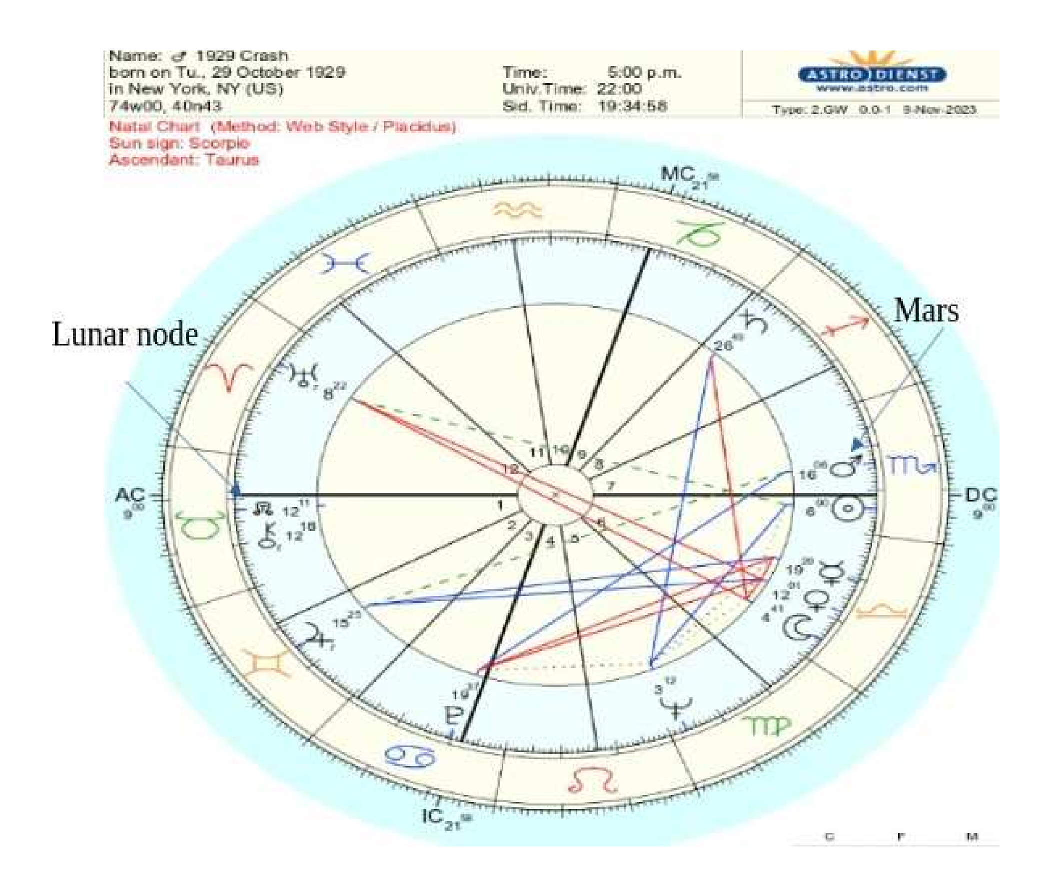

For transactions that span long distances over a digital platform, the participants would have provide proof that they belong to a community in which the members ascribe to a belief in Mars influence. Each community would have a database of each of its members and their astrological natal Mars position, according to how it is explained in the book “The Mars 360 Religious and Social System”. All members would be identified according to that layout as either a Mars-1, Mars-2, Mars-3, Mars-4, Mars-5, or Mars-6. This database would be shared with a central database, allowing only the names in that database to buy gold with the Mars Redback private notes. These early communities would later form the basis of the next central bank in the US who would work in tandem with Amazon’s bureau of Engraving and Printing department.

The Mars Redback financial system would be maintained by an ecosystem and its value would be based on Mars being within a certain alignment in the heavens. The Mars Redback system would replace the US dollar when a stock market crash or bank run occurs when Mars is within 30 degrees of the lunar node. During such an event, as bank runs and other catastrophe’s unfold, the Federal Reserve would be later phased out and Amazon would take over the economy as a private entity that controls the printing of Mars Redbacks. You’re probably asking how can a certain planetary alignment give rise to a currency of which is based on it. The answer can be found in the fact that all the major stock market crashes that occurred in the US happened when Mars was within just 4 degrees of the lunar node, and such correlations are enough to persuade consumers of the legitimacy of the new Mars Redback currency, compelling them to trade in their US Dollar for Mars Redbacks. Lets look at some correlations that foster faith in the legitmacy of a currency whose value is based on a planetary alignment.

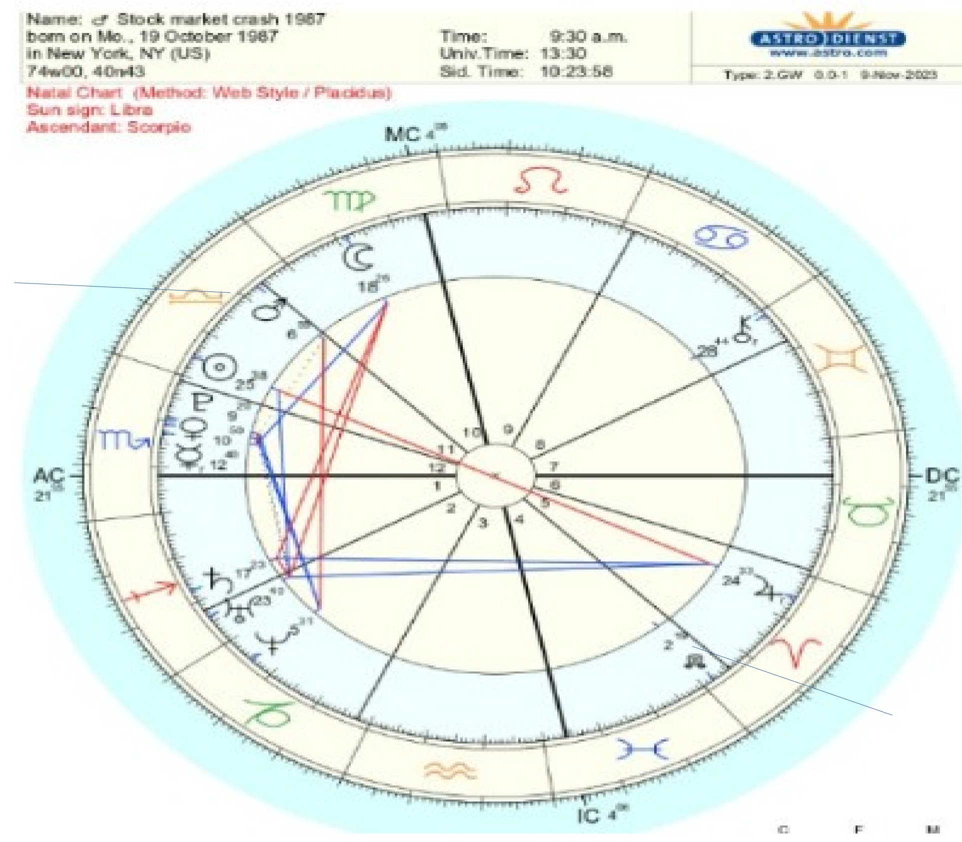

The book "The Mars Hypothesis" by Anthony of Boston presents the idea that the Federal Reserve can set interest rates based on the movements of the planet Mars. In this book, data going back to 1896 shows that as of April 2020, percentage-wise, the Dow Jones rose 857%. When Mars was within 30 degrees of the lunar node since 1896, the Dow rose 136%. When Mars was not within 30 degrees of the lunar node, the Dow rose 721%. Mars retrograde phases during the time Mars was within 30 degrees of the lunar node was not counted in that data as Mars being within 30 degrees of the lunar node. The purpose of the book is to not only hypothesize that the Federal Reserve can set interest rates based on the movements of the planet Mars, but to also demonstrate exactly how and at the same time, formulate a system that would enable the Federal Reserve to carry out its application in real time. Using the observation of the planet Mars, the book contains a strategy for controlling inflation, interest rate setting recommendations and the predicted dates of future bear market time periods all the way thru the year 2098.

The overall hypothesis is that Mars influences human behavior in a very negative way, not just on investors, but people in general. Here are the charts for the October 29, 1929 stock market crash, the October 19, 1987 stock market crash, the 2020 stock market COVID-19 crash (notice that Mars is located very close to the lunar node, within 1 -4 degrees. This is not a coincidence)

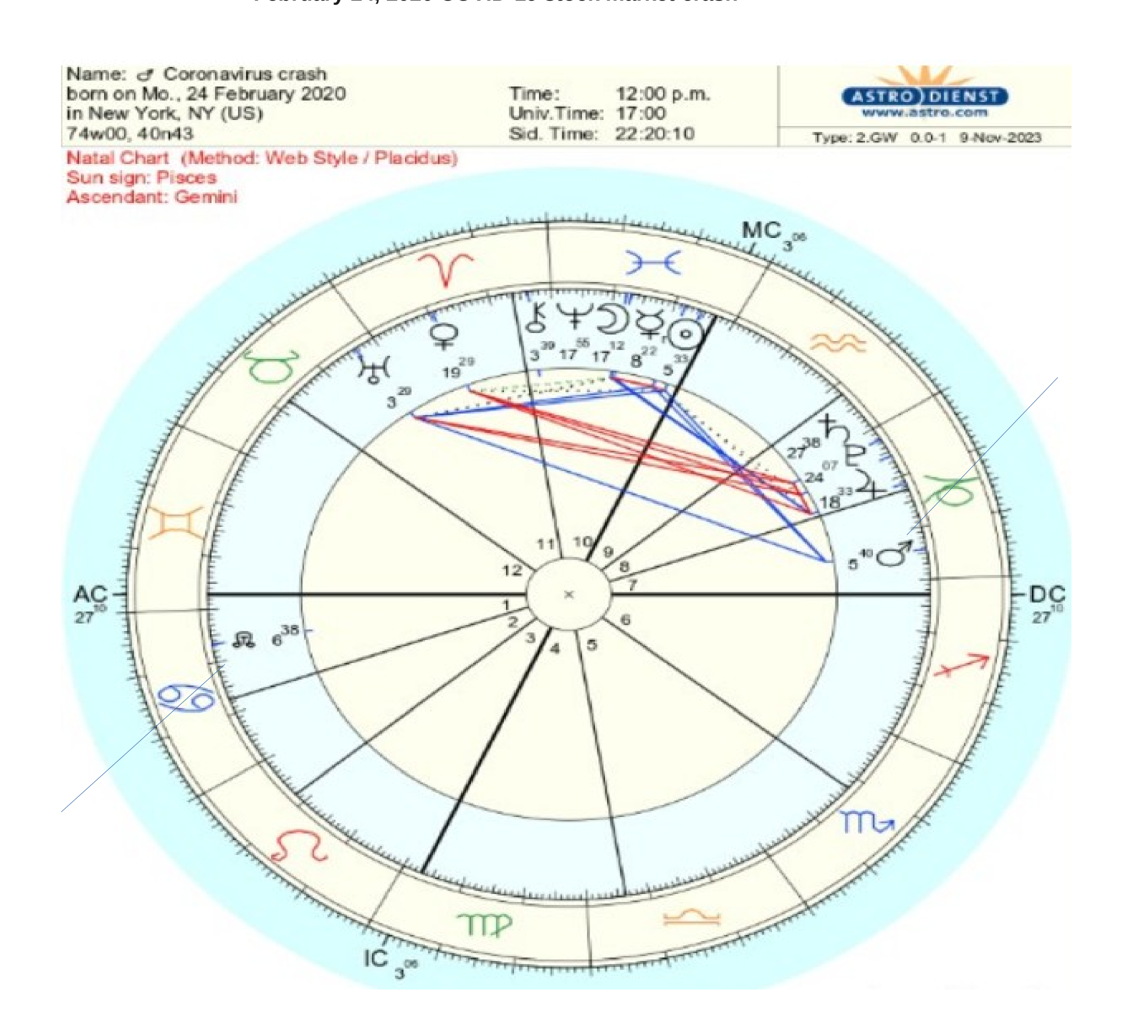

October 29, 1929 stock market crash

October 19, 1987 stock market crash

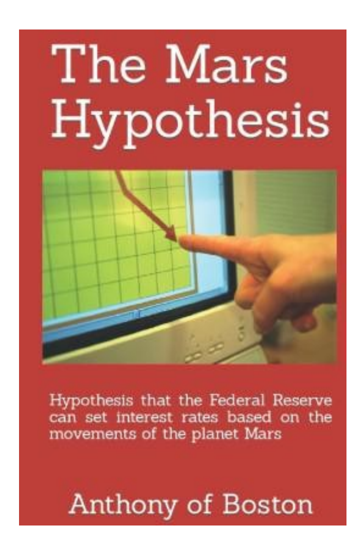

February 24, 2020 COVID-19 stock market crash

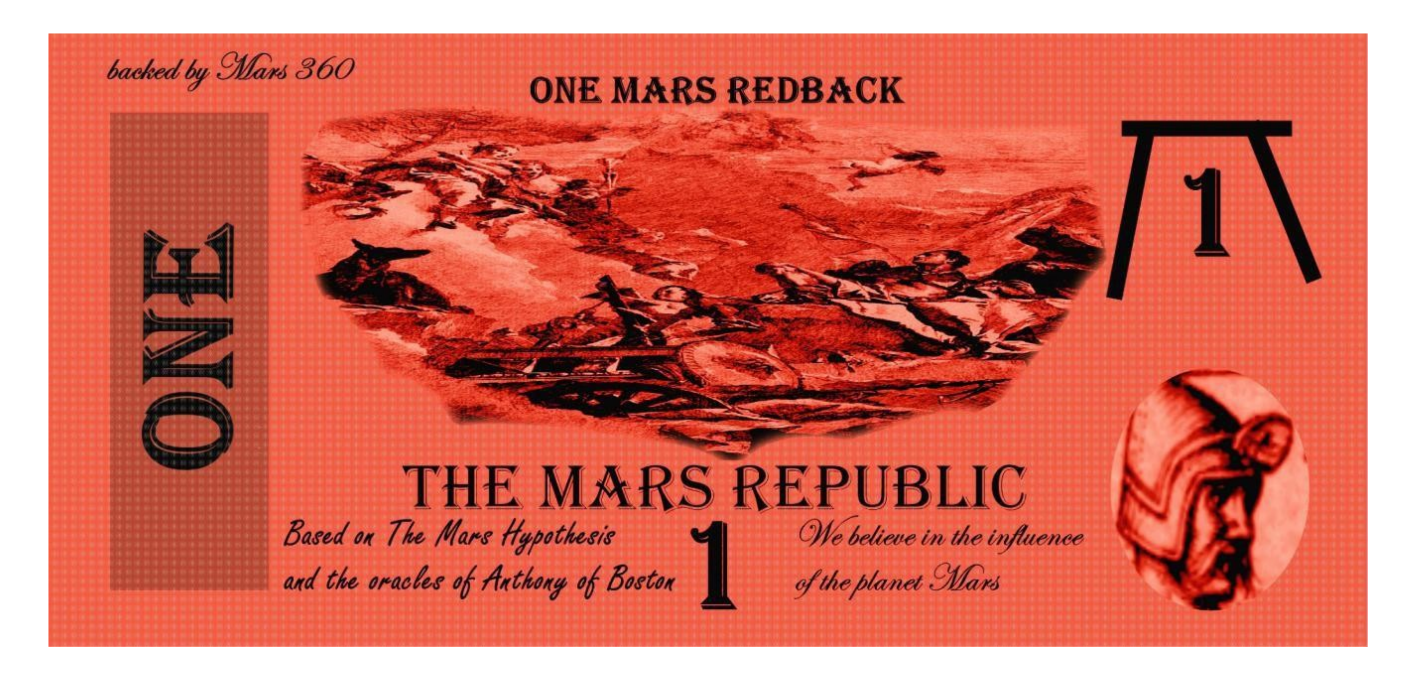

It is easy to predict that the next major stock market crash will occur when Mars and the lunar node are in a similar close alignment. This information makes it easy to confer enough value to the Mars Redback currency, such that it could become legal tender overnight, capable of settling both public and private debt. In the event of a crash or bank run happening at the right time of Mars and the lunar node being in close alignment, the existence of private Mars Redback currencies, which is available on Amazon, would allow Amazon inc to take over the US economy and print Mars Redbacks, set the exchange rate and get the economy running again.

From there we have an ecosystem. The book "200 Private Mars Redback notes" would be exchanged for US dollars on Amazon, to which then the US dollar proceeds would be used by Amazon/new central bank to buy gold, which would then be accepted in exchange for Mars Redbacks, which would then be taken out of circulation. Ideally, transactions with the Mars Redback must be done with the participants in the transaction showing where Mars is located in their astrology birth chart, identifying themselves as either a Mars-1, Mars-2, Mars-3, Mars-4, Mars-5, or Mars-6. Of course, this decree can be made at a later time, after the economy is up and running again

Interest rates can then be set with "the Mars Hypothesis", perhaps by simply raising the price of the book "200 Private Mars Redback notes" when Mars is within 30 degrees of the lunar node. In order to gather how interest rates would be managed, one can read the book "The Mars Hypothesis" which hypothesizes that the Federal Reserve could have set interest rates based on the movements of the planet Mars. The book also lays out future dates of when interest rates should be either raised or lowered.

Here is a diagram of the Redback currency: 200 of these private notes can be found in the book "200 Private Mars Redback Notes"

Here is further explanation of the new economic policy under the Mars Redback currency system. It starts out as a two-currency system until US dollars are eventually taken out of circulation and the Federal Reserve eventually dismantled.

In the initial stages of the Mars Redback currency system, the Mars Hypothesis is applied to interest rate policy. When the Sun enters within 30 degrees of the lunar node, the Fed would mark that as the beginning of a season in which the demand for currency and credit would be very high. They would thus deciare the start of a bear market, predict and raise interest rates. The ensuing Mars phase can be monitored for sudden market disturbances. If a market disturbance takes place during this phase, the new central bank(Amazon) would respond by injecting a separate Mars currency into the economy in order to stabilize it.

Since 1973, the value of the dollars tied to a critical alliance between the United States and Saudi Arabia in which Saudi Arabia would agree to sell their oil for US dollars. When President Joe Biden entered office in 2021, he took an antagonistic approach towards the Crown Prince of Saudi Arabia Mohammad Bin Salman(MBS), threatening to have him prosecuted for the murder of Jamal Khashoggi, a US resident murdered under mysterious circumstances at the Saudi consulate in Istanbul, Turkey. MBS responded to this threat by offering to sell Saudi oi] to China for the Chinese Yuan instead of US dollars. As a consequence, Biden was likely warned about the dangerous implications of this and thus since that time, Biden has backed off MBS, making a 180 degree turn, granting MBS immunity during the Khashoggi lawsuit. However, irreparable damage has already been done, setting the stage for Saudi Arabia to seek security elsewhere. The value of the dollar is set up in such a way that its decline would happen overnight, and not over a long period as some experts believe. If ties between Saudi Arabia and the United States collapse, then all it would take is one announcement from the Crown Prince, stating an end to the petrodollar agreement, collapsing the dollar, followed by all hell breaking loose in the United States, bank runs, unemployment, crime, etc.

So now one has to ask, what is to be done in this situation? Fed can no longer raise interest rates to raise the value of the dollar, and this is because they have made it clear that they would just print extra paper currency to bail out the failing banks. They did this in 2008 and again in 2023 with the bailout of Silicon Valley Bank. Thus one cannot simply say--as a rebuttal--that the all the economic problems in the US would be solved if the Fed would stop printing excess money. Reason being, is that socialist groups in the United States would not put up with the austerity that comes about from decreased government spending. They would literally point to 2008 and 2023 as examples that more stimulus and more money printing is feasible and warranted. Hence, why it's proposed in this writing that a second currency be issued in the event of a bank run. The currency that would be issued is called the Mars Redback and its value is based on faith derived from signs performed that show that Mars has an influence on human behavior. Anyone can observe these demonstrations by reading the books "Ares Le Mandat" and "The Mars 360 Religious and Social System." or "The Deus Armaaruss"

So now there is a plan, a currency, and a mechanism for its value. The next part is to get the Mars Redback into circulation. The method of printing can happen through a private intermediary(Amazon), creating an ecosystem where the dollar, the Mars Redback, and gold are exchangable, giving each other value. The US dollars exchanged for Mars Redbacks would be used by the new central bank to buy gold overseas from India. Amazon and other major US companies would then deter those US Dollars from coming back into the United States by rejecting US cash payment for their goods and services. There is no federal statute which

mandates that a private business have to accept US currency or coins as payment for goods or services. Meanwhile, the Mars Redbacks later exchanged for gold would also be taken out of circulation. However, unlike the US Dollars, the printing of Mars Redbacks would continue in accordance with the Mars/Lunar node dynamic until US dollars are completely phased out and sent overseas in exchange for gold. This would continue until there are no more US dollars in the United States and until its overseas value eventually dwindles to zero. The latter would occur as a result of the Federal Reserve's attempt to keep printing US Dollars in order to stop the rise of the Redback. Keep in mind that this scenario would happen during a time in which the Petrodollar agreement is no longer valid.

A major issue that arises pertains to how the value of the Mars Redback is couched to the position planet Mars when it is within 30 degrees of the lunar node. In this regard, speculators could simply buy up Mars Redbacks outside of the designated alignment that confers value. Investors would rather acquire the Mars Redback for cheap when Mars is not within 30 degrees of the lunar node, as opposed to buying them up during the value phase of Mars being within 30 degrees of the lunar node, since at least according to how this idea has been presented thus far, the Mars Redback would soon thereafter began to lose value when Mars goes out of the specified alignment that confers value. This model gives the currency insane volatility as speculators would hurry to get rid of the Redbacks when its value predictably goes up during the alignment between Mars and the lunar node within 30 degrees. In this regard, bringing this element of a second currency into the fore along with seasonal interest rates based on Mars position cancels out the deflationary aspect and actually reasserts the inflationary model that defines the current financial system under the Fed since 1913. Even backing the Mars Redback with gold under this proposed model still leaves the question of how will the gold be acquired and would there be enough gold to keep up with the amount of Mars Redbacks in circulation.

There is a predictable change in the Mars Redback's value that leaves it open to exploitation by speculators. Speculators can simply buy up and hoard all the Mars Redback notes when Mars is not within 30 degrees of the lunar node, and then subsequently exchange those Mars Redbacks for gold when Mars goes into the phase of being within 30 degrees of the lunar node. Shortly thereafter, when Mars exits from being within 30 degrees of the lunar node, the speculators could then buy up cheaper Mars Redbacks with just a small percentage of their gold profits, leading to less gold being available for the backing of Mars Redbacks.

The gold part is a problem because it was mentioned that after the central banks would allow gold to be exchanged for Mars Redbacks, those Redbacks would then be taken out of circulation, reducing the money supply. However, the conundrum is that Mars Redbacks are deemed to hold less value outside of Mars being within 30 degrees of the lunar node. So in that case, as mentioned before, the speculators can buy up a greater share of circulating Mars Redback notes with a fraction of their gold profits when Mars is out of alignment.

However, a key component of this model, is that much of the value of the Redback hinges on the timing of a bank run or cash demand. If the bank run occurs outside of Mars being within 30 degrees of the lunar node, issuing the Mars Redback currency in that case so that banks can buy time to clear up insolvency issues may not have that intended effect. And as far as speculation, speculating would come down to anticipating when the demand for currency and cash would increase. The Mars Redback gains value when such events coincide with the aforementioned alignment (Mars within 30 degrees of the lunar node). So its not the alignment alone that gives the Mars Redback value, but the liquidity crisis or cash demand that should coincide with the planetary alignment.

So now we add a stipulation with the one that says that currency or cash demand for U.S. Dollars coinciding with the Mars/lunar node alignment boosts the value of the Mars Redback. Another parameter that states that the Mars Redback"s value is also upheld by a lessened cash demand for US dollars when Mars is not within 30 degrees of the lunar node. This should make the Mars Redback more stable year round and less susceptible to speculator plays.

So now we would have two parameters that would stabilize the Mars Redback

1. Cash demand for US dollars or bank runs occurring when Mars is within 30 degrees of the lunar node as something that raises the value of the Mars Redback

2. Allow cash demand for US dollars occurring when Mars is outside of being within 30 degrees of the lunar node as something that also maintains the value of the Mars Redback.

So now in this scenario, when Mars is out of alignment, the value of the Mars Redback is upheld if there is no significant US dollar cash demand from banks. Now the speculators would have to anticipate a bank run or US dollar demand occurring outside of the Mars/lunar node alignment in order to calculate a favorable time to buy up Mars Redbacks with their gold profits. This would make the altering value of the Redback a more feasible model since its value is a bit more random and controlled by unknowable events like bank runs. This keeps speculators at bay. Placing the impetus for the value of the currency both on planetary factors along with unknowable events helps mitigate the problems of arbitrary human decision making and exploitation by speculators.

The Mars Hypothesis was designed to do away with that arbitrary aspect of monetary policy makers having all the power of setting interest rates. In fact, the Mars Hypothesis is built around the way interest rates were seasonal before the creation of the Federal Reserve in 1913. It thus attempts to apply a seasonal aspect, though not exactly in terms of how those seasons were applied prior to the Federal Reserve. But moreso in terms of how the seasons would apply to planetary alignment. So in this sense, it was anticipated that much like the financial system prior to the creation of the Fed where bank runs were more common than inflation, the financial system under the Mars Hypothesis would also be more prone to bank runs than high inflation. So thus, a mitigating element is now applied. It Is proposed that a second currency(The Mars Redback) be issued in the event of a bank run and its value is based on Mars being within 30 degrees of the lunar node. But as mentioned previously, this is ripe with flaws and makes the value of the currency too predictable and prone to speculator exploitation. So in order to circumvent this, we now can base the value of the Mars Redback on when the bank runs or cash demands would occur in relation to when Mars is within 30 degrees of the lunar node, which should keep speculators off guard.

The Mars Hypothesis tries to set up a financial system much like a constitutional republic, with the timing of interest rates set in stone based on planetary alignment, keeping the human element out of it. Putting in parameters that would keep speculators guessing is obviously a major factor in keeping the system stable. However, it must be reiterated that the Mars Redback's value is ultimately based on financial crises occurring when Mars is within 30 degrees of the lunar node. So over time, if this becomes ascertained NOT to be the case, the whole system is in jeopardy of collapsing.

The danger here is that proponents or detractors of the system could try to orchestrate events to ether maintain the system or subvert it, depending on where they stand. The Mars Hypothesis, however, claims that it is impervious to level-2 chaos.

The Mars Hypothesis tries to find a balance between deflation and inflation, all while applying a constitutional framework where the major decisions of monetary policy are essentially made by the planetary alignments,as opposed to being made by human beings. Still and all, the human element is still a necessity, because with every doctrine or constitution, a body is needed to interpret it, and hence why it's quite probable that should Amazon become this interpretative body, there would arise that human propensity to apply amendments to the Mars Hypothesis.
